

## AIDS And the Heterosexual

The first wave of the AIDS (Acquired Immunodeficiency Disease Syndrome) epidemic predominantly affected young gay men, but the next wave is predicted to strike down young heterosexual men and women in their prime. There have been literally thousands of scientific studies on the subject of AIDS. Many important facts related to the spread of AIDS among heterosexuals have been found. The only way to stop the AIDS epidemic is for every sexually-active individual to be thoroughly familiar with all these facts. Several areas of vital importance are covered in this book.

**HETEROSEXUAL TRANSMISSION.** The public's impression of what constitutes causal contact versus intimate contact may be very different from a medical expert's point of view. Yet, this is one subject which is often misunderstood by many people. A clear understanding by everyone on how HIV is transmitted from one person to another will have an important impact on the spread of AIDS within the general population. **RISKS.** Knowing what the risks of infection are, and an earnest attempt to assess such risks will greatly decrease one's chances of becoming infected. A person should know if he or she is in a dangerous situation before engaging in sexual activities. **PROTECTION.** Using a condom is not the ultimate answer in preventing infection. However, it is the only effective protection we have at this time. On the other hand, studies have shown that many people use condoms in an improper and ineffective manner, which negates all the best advantages of this form of protection. Here is one book that will address all these topics in a very detailed manner so that every sexually-active heterosexual individual will be able to quickly and efficiently assess every situation in which he or she might come into contact with an infected person and thus be in a better position to avoid

infection.
