

The Living Brain and Alzheimers Disease (Research and Perspectives in Alzheimers Disease)

From large cross-sectional studies of autopsy material, it seems as if a time course of Alzheimers Disease, at least on average, can be mapped out: a pattern of hierarchical vulnerability for neuronal loss and neurofibrillary tangles beginning in medial temporal lobe structures proceeding through association areas. Plaques follow their own temporal course, with widespread cortical deposits occurring even early in a disease process. The whole process may well take twenty years, the first half of which may be without overt symptoms.
