

# Nursing Education and Relationships: Facilitating the Development and Competency based Assessment of Personal and Social Competence with Undergraduate Nursing Students

This qualitative research project explored the experiences of nurse educators who sought to assess aspects, which could be related to facilitation of emotional competence, in nursing students. Focus groups were conducted in three different educational institutions, offering a Bachelor of nursing degree. Each of the participants had a teaching and assessment role within the school of nursing. The contributions of the nurse educators and their interactions were audio taped, transcribed and then later, analysed using thematic and focus group analysis practices. From the analysis of the experiences of the nurse educators, four predominant themes arose which capture the areas of importance to the participants. Student nurses can develop emotional competence by critically reflecting during classroom and clinical experiences. Continuous consideration must be made within each practicing area of nursing, of the environmental and relational challenges which inhibit or facilitate nurse's ability to practice with emotional competence.
